

January 26, 2007

The team received a new project today. Higher-ups call it the Human Enhancement Project. Dr. Laurier is spearheading the project, he's a good man.

March 5, 2008

We received the test subject. Seo Dalmun – 10 years old. Everyone on the team is hesitant, even Dr. Laurier... Why the hell did they bring us a child?! We fully expected the usual test subjects... you know, rats?

We'll just keep going, I guess. We decided to call the subject 'Mun'. She's a bright child. I wonder how they found her...

April 18, 2008

The team decided on not experimenting on little Mun for now. Genetic enhancement on mice has begun, no results yet.

June 15, 2010

Mice show better physical performance. Disease immunity modifications also seem to be going well. The team is a little tired, but little Mun always manages to cheer us up! We had a playground set up for her in the unused part of the lab. Haha! She seems to be enjoying it.

June 20, 2010

... The higher ups are forcing us to start our experiments on the little one. They have our families as hostage. I... I'm sorry.

December 8, 2010

We decided to hold a small party for Mun. She's happy! We feel very guilty now...

Advanced Merry Christmas, little one.

October 18, 2012

Little Mun is in a lot of pain. We don't want to do this anymore.

October 5, 2012

... they locked us in.

January 5, 2013

We heard the other team's success on simulation technology. They said they were inspired by the Matrix? Hm...

Perhaps we can get Mun into one. Lessen her suffering, at least.

February 19, 2013

Higher ups allowed the use of simulations. They want us to make her experience history in person. That's 6000 years! We decided to use one of the servers to store memories... if that makes any sense. She's connected to it by wire, but we're working on setting up a wireless connection.

March 5, 2013

We managed to outfit her with a little transceiver... we ought to start the simulation soon.

May 22, 2013

Update: It's been a while since the little one has been in the simulation. About 2000 years? She's doing alright, I hope. Storage capacity is at 20%... We're all getting tired tormenting her.

June 5, 2013

The experiments are coming to an end. Mun is currently our best work... if you can even call it that. Hah, we're monsters.

Status updates? She's practically ageless now. Stuck in her current form as a teenager. Simulation is 4215 years long now. Not much to go through.

June 14, 2013

We plan on getting Mun out. We don't want her to stay here any more that she has. We're stopping the experiment. Keeping this all a secret, of course.

June 19, 2013

Backing up files and reports to show the public. I've set up multiple security measures for this.

July 9, 2013

We changed the door passcode to something else. I'll share it here when they aren't looking. For now, I made this journal password protected using the server lights as binary. Smart, I know.

July 24, 2013

Ah. They found out. They got a little stricter... they didn't notice the password changes, at least. Some security changes, we told them.

Anyway... I'll be encoding the password here, just in case. The days are the key, hm?
